InfiniMite VIDEO/MACHINE VISION LENSES

The difference between the Alpha and Beta models is that the Beta produces the same magnification as the Alpha, but with approximately 50% greater working distance at any given time. Likewise, the difference between the Beta and Gamma models is that, with the exception of its starting magnification, the Gamma produces the same magnification as the Beta, but with approximately 50% greater working distance at any given time. Consequently the three models represent steps in a progression of “smart magnifications”. Please refer to the magnification charts for specific details.
